WALK-UP EXHIBIT

TEARDOWN

Bringing rocket science down to Earth.

Drawing for the story. Not a picture of the app.

WHY IT EXISTS

Watching is not the same as understanding

A launch is easy to watch and hard to explain.

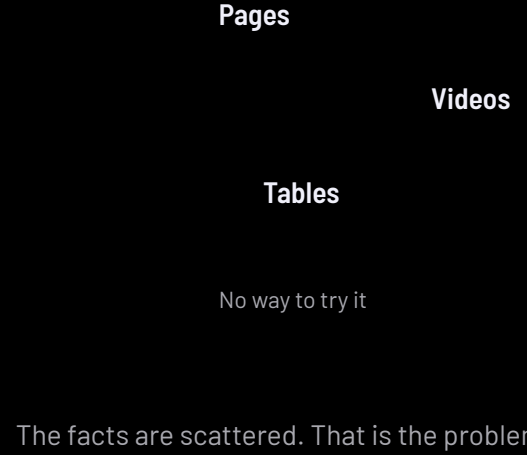

The facts are public, but they sit in different pages, videos and tables.

None of that lets a kid take a rocket apart, ask it a question, or try to fly one.

Made by Neel Bansal and Anders Haroldson

Student project. Not affiliated with SpaceX or xAI.

Model: “Falcon 9 - SpaceX” by Stanley Creative, CC BY 4.0. Model page

The facts are scattered. That is the problem, not a statistic.

EXPLORE

TAKE THE ROCKET APART

Drag, pinch, or use the keys to turn a real Falcon 9 model and move closer.

Pull the parts away from each other, then tap a part to read what it does.

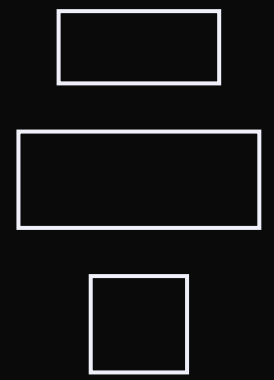

Hard words stay, with a plain meaning in the same sentence.

Made by Neel Bansal and Anders Haroldson

Student project. Not affiliated with SpaceX or xAI.

Model: “Falcon 9 - SpaceX” by Stanley Creative, CC BY 4.0. Model page

PLACEHOLDER

A shape of stages pulled apart. Not the Falcon 9 model.

Placeholder. Not a screenshot. Explore is not built on this branch.

YOUR MISSION

FLY IT FROM THE GROUND

You start on a launchpad, on a round Earth, with space behind it.

Pitch is how you tilt. Throttle is how hard the engines push.

Go straight up, or turn too hard, and the path falls back to Earth. That miss is computed. Nothing types in a win.

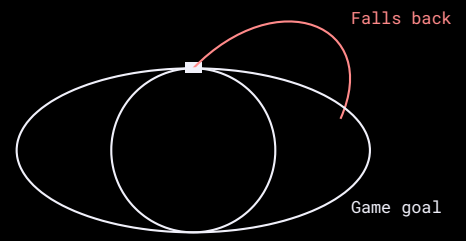

The game goal is a path around Earth: lowest point at least 200 km up, highest point no more than 2,000 km up, engines off for ten seconds. Those are settings for the game, not a rating of a real rocket.

Live demo: fly it only when the build can really fly. If it cannot, stay on this slide and say so.

Made by Neel Bansal and Anders Haroldson

Student project. Not affiliated with SpaceX or xAI.

Model: “Falcon 9 - SpaceX” by Stanley Creative, CC BY 4.0. Model page

Placeholder drawing. Not a flown path, and not a success.

OPTIONAL CONTROLLER

The laptop flies. A phone can steer.

Mouse, touch and keyboard can fly the whole mission with no phone at all.

To use a phone: scan a code, allow motion, hold still to set zero, then tilt to set pitch.

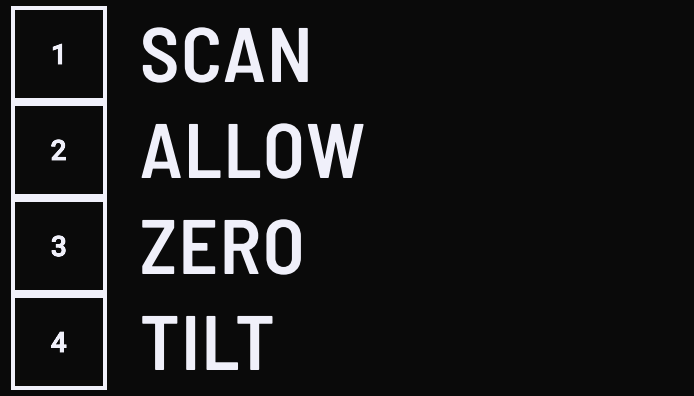

If the phone drops away, the flight pauses. Old wiggles are thrown out. You choose to go on with the laptop.

Student project. Not affiliated with SpaceX or xAI.

Model: “Falcon 9 - SpaceX” by Stanley Creative, CC BY 4.0. Model page

PLACEHOLDER

No phone photo yet. The laptop path does not need one.

Placeholder. Not a photograph of a handset or a shell.

FLIGHT REPLAY

A past launch, and your flight

Replay shows published moments from a named launch, with the source and what we do not know. It is not a live feed of speed and tilt.

Your mission is a simulation. Its numbers come from the model and your inputs.

The carbon line is an estimate of direct engine carbon dioxide (CO_2) from fuel the simulation burned. It is not a measurement, not the rocket's whole life, and not a soot score.

A past launch and your flight do not share one total. If a number is missing, the screen should say so.

Student project. Not affiliated with SpaceX or xAI.

Model: "Falcon 9 - SpaceX" by Stanley Creative, CC BY 4.0. Model page

PUBLISHED MOMENTS

Named launch, source, and what we do not know.

SIMULATED FLIGHT

Numbers from the model and your inputs.

ESTIMATE. NO TOTAL IS SHOWN, BECAUSE NONE HAS BEEN CALCULATED.

Not a screenshot. No carbon-dioxide figure is claimed.

HOW IT WORKS

One helper moves the rocket

Your hands set pitch and throttle. One owner at a time for each control.

A physics helper is the only thing that moves the rocket. The picture cannot invent the path.

The guide can explain the screen. It cannot steer, and it cannot award a win.

Grok text, voice and pictures need a key that stays on the server. If they are unreachable, the flight still runs, and the screen says it could not reach Grok.

Made by Neel Bansal and Anders Haroldson

Student project. Not affiliated with SpaceX or xAI.

1 HANDS

2 PHYSICS HELPER

3 GUIDE EXPLAINS ONLY

4 GROK ON THE SERVER, OR AN HONEST OFFLINE LINE

The picture does not get a vote. The guide does not steer.

TRY IT

Take one apart.
Watch one. Fly one.

That is the exhibit.

This page is the animated deck. The still copy is the PDF next to the speaker notes.

A public link and a timed recording are not ready. We will add them only after they work.

EXPLORE
REPLAY
FLY

Three modes. No separate Engines or Emissions destination.

APPENDIX · NUMBERS

Where a number may come from

A published fact wears its source.

A simulated readout comes from the flight helper and named inputs.

An estimate wears that word, plus the assumptions it used.

Missing data stays missing. We do not fill the gap with a sample flight.

Made by Neel Bansal and Anders Haroldson

Student project. Not affiliated with SpaceX or xAI.

SOURCE
SIMULATION
ESTIMATE
MISSING STAYS MISSING

The orbit goal is a game setting

Altitude alone never wins. A rocket that only goes up comes back down.

The helper checks a bound path: periapsis at least 200 km, apoapsis at most 2,000 km, and ten seconds with the engines off.

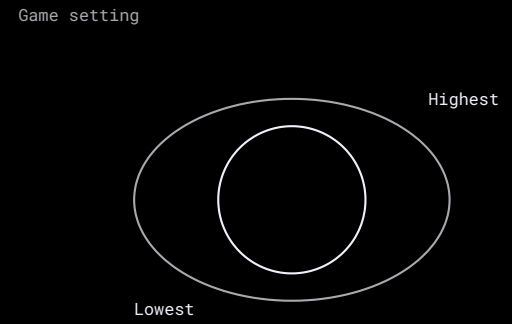

Periapsis means the lowest part of the path around Earth. Apoapsis means the highest part.

Low Earth orbit still feels drag. Ten quiet seconds are not a promise that the path lasts.

Made by Neel Bansal and Anders Haroldson

Student project. Not affiliated with SpaceX or xAI.

Model: “Falcon 9 - SpaceX” by Stanley Creative, CC BY 4.0. Model page

Not a result. Altitude alone never wins.

APPENDIX · SCOPE

LEFT OUT ON PURPOSE

No engine-out sandbox, and no control that turns engines off to fake a lesson.

No docking, and no space stations.

No booster-landing game.

No trips to the Moon or other planets.

The old checkpoint mission, coach hints and star scores are retired. They are not a hidden mode.

NOT IN THIS BUILD	Engine-out sandbox
NOT IN THIS BUILD	Docking and stations
NOT IN THIS BUILD	Booster-landing game
NOT IN THIS BUILD	Other planets
NOT IN THIS BUILD	Stars and checkpoints

APPENDIX · OPEN ITEMS

What we still have to capture

Every empty box on this slide is still empty. A placeholder is not evidence.

Replace a box only with a capture from the running app, a real handset, or a measured rehearsal.

Made by Neel Bansal and Anders Haroldson

Student project. Not affiliated with SpaceX or xAI.

Model: “Falcon 9 - SpaceX” by Stanley Creative, CC BY 4.0. Model page

- [ ] Explore capture from the running app: the real model, parts pulled apart, and a selected part.
- [ ] Flight replay capture: a named launch, its source, and the limits on what is not known.
- [ ] Your mission capture: a crash caused by flying, a retry, and an orbit reached only by flying.
- [ ] Phone photo: the code, the motion permission, the zero pose, and a tilt, plus the pause when the phone disconnects.
- [ ] A local recording of a flight that was really flown, with no forced success.
- [ ] A live demo link that has been opened and checked.
- [ ] Measured presentation time in the confirmed event slot.
- [ ] Hallway notes from people who tried the finished exhibit.
- [ ] Neel's visual review of this deck against the running app.

Empty on purpose. None of these captures exist yet.
